CHALLENGES OF GLOBALIZATION

SELECTED FEATURES OF NEW ECONOMY AND ITS IMPACT ON BUSINESS MANAGEMENT

Key words: New economy, globalization, changes, skill, management, performance.

Abstract: Article focuses on selected features of the new economy, especially globalization, changes brought about as a consequence, new skills required for management, including a shift in the indicators for assessing business performance.

Introduction

The end of the eighties of the last century was marked by a sharp increase in the dynamics of the market environment. Turbulence increases in the threshold of chaos (Trunecek, 2003). “Our only certainty is that things will change” (Gibson, 1998, p.195). However, it is clear that some new phenomena can predict the future market, e.g. discovery of new consumers: The pension will not be a period of inactivity, children today will control the Internet, and wealthy people will discover luxurious things like plastic surgery, personal trainers or training courses.

Previously negative reviews of the turbulent environment conceived as a threat are beginning to change. Discontinuities have begun to be considered a challenge - prepared companies can find new business opportunities.

But it is clear that current management systems are not able to solve the problems of a new era. Corporate governance requires a new philosophy. Management has become a management of change, which does not only enhance the performance of the organization, but also the humanization of its work. This gained managerial control on two levels: the hard layer covers methodology and management techniques, the soft layer concerns attitudes. It is clear that no plane can be underestimated.

New economy

The environment of the new economy is characterized by a shift in the structure of business resources. The growing importance of intangible assets and sources of potential change are explained in the following figure.

FIGURE 1 THE DE-CAPITALIZATION OF THE COMPANY

Note: Reworked from Ruthner (2002).
The emerging competitive landscape of the new economy, aptly characterized by Prahalad (1998). Identifying eight discontinuities accompanying the new economy; environmental friendliness through control, standards, and vague boundaries between industries, convergence, fluctuations in demand, deregulation, privatization and globalization. Their businesses will be affected differently, but generally speaking, are all forced to reconsider their “business” model in order to meet the requirements of the new environment.

In the management of discontinuity, managers will be confronted with complex new challenges. Enterprises in the new environment must cope with new skills. Management capabilities of the new global marketplace are a complex task, which has at least five different components (Prahalad, 1998):
- gaining access to new knowledge and learning to use it;
- integration of many different areas of expertise;
- collaboration within different cultures crossing large distances;
- learning to jettison negative things - to overcome the routine;
- coordinated implementation of competence in many business units.

Creating new capabilities and selective use and protection of existing capabilities are very complex tasks for the company, both in terms of intellectual skills needed for workers in an organizational perspective. Minimum requirements include: a large investment in bringing together people of different cultures within the company, improving language skills, extensive documentation - not red tape, extensive training for both analytical and experimental site management.

Globalisation

All levels of the economy and society are fundamentally influenced by globalisation processes. Between representatives of business and management theory, there are two directions for views of the implications of the effects of globalisation. The first stream includes supporters of the view that globalisation is a battle of “wits” taking place only among the most advanced countries: “the 21st century is the century of competition of all against all - one wins, others lose” (Thurrow and Heilbrone, 1982, p. 38).

Proponents of the second stream argue that in globalisation all win, have the same opportunity and it depends only on them, how it can be used: “The global economy is a networked economy. The more companies there, the more a space for new businesses.” (Neumaierová and Neumaier, 2002, p. 20). “Globalisation creates greater risk and more opportunity for everyone” (Kotter, 1996, p. 56).

Changes which globalisation brings

Despite the fact that globalisation is a universal trend today, with him acting as a centrifugal, disintegrating forces. There is a change in the traditional direction of movement of foreign capital. Instead of exporting capital to areas with cheap labour there is a preponderance of the exchange of capital between developed countries. Change in allocation criteria is due to growing demands for skilled labour, preferring to support the technological environment, increasing the importance of infrastructure and no less severe, monetary and political stability.

Megatrends act on consumer behaviour. The result of which mean target groups frequently are unstable, which complicates the marketing conclusions. On the one hand, a global consumer model, in which it is necessary to work, on the other hand is reflected national and regional values (Borbasz and Szabo, 2006). Along with changes in consumer behaviour, as well as the behaviour of competitors. A new situation where multinational corporations have formed in some areas of their business, strategic alliances with those with whom they can in other commodities compete seriously.

Globalisation can be understood in two ways (Basl, 2002). First, it is a vision that would be called “inside - out.” This is dominance for business and often the user. From this perspective, globalisation offers opportunities for further growth. On the other hand, mainly outside the business sphere brings a perspective “outside - inside, where are much more prominent limitations, implications and risks.

<tr>
<td>Dominating local optimization from the perspective of business and the consumer</td>
</tr>
</tbody>
</table>

Note: Reworked from Basl (2002, p.16).
The issue of globalisation is a powerful incentive to think about sustainable development. When we contemplate the concept of sustainable development, we would need to respect the laws of nature, deliberate exploitation of natural resources and an awareness of the links between global and local issues. However, the term includes in addition to environmental issues as well as social, cultural, technical, but also economic aspects. And this touches every enterprise. Depending on how they set the parameters of the economic environment, the company maintained in the environmental. It is essential that the firm pays in improving economic performance reduce the environmental burden (Neumaierova and Neumaier, 2002).

Company performance

In the new environment, a company has to ensure its survival, and any subsequent developments, to accept the new conditions. Globalisation touches the entire company. Practically, this means that the overall decline in protectionist measures in previously closed markets. A key success factor is the ability to produce, but of great importance is ability to sell. As a consequence, among other things, all employees are becoming more customer oriented, and this involves not only the dealer or salespeople.

<td>More loyal customers.</td>
<td>Customer demands increasing.</td>
</tr>
<tr>
<td>Employees must comply with regulations, to ensure low costs.</td>
<td>Employees must be more creative and more customer oriented.</td>
</tr>
</tbody>
</table>

**Shifts in indicators evaluating company performance**

Entirely logically there is a shift in indicators evaluating company performance (Table 4).

Understanding and ways to achieve the performance criteria vary with the development of a system of wealth creation in the company. A current concept of management, according to the current stages is value based management, based on the theory of management values. This concept already includes measurement systems and overcomes some shortcomings of traditional accounting. Based on the premise that the criterion for the correctness of each decision and each action is an increase in market value. Focusing on value creation, is supported by measuring the added value arising from the performance of people, processes, suppliers and the customers. The basis for generating value is a sophisticated strategy. Performance measurement promotes the transformation of strategy into action.

</table>

Note: Reworked from Učič et al. (2001, p.27).

This approach to the evaluation uses only financial indicators such as economic added value (EVA) and market value added (MVA). A tool for value based management is shareholder value analysis.

Conclusion

Within the global economy it is not low performance of the company which is the biggest threat to their business success, but its irrelevance to the changes in customer attitudes and the development of its surroundings. Typically, two key areas are highlighted in which at present lie the greatest potential for business benefits. First are the stimuli from the external environment, presenting new opportunities for information and communication technology, where the internet plays a key role. In this context, we can find such as the virtual company, supply chain, customer relationship management, etc. The second area lies in understanding and mastering new tools and methods for all workers, including changes in the methods and rules of behaviour that affect the improvement of business processes. Here we find the new communication technologies, understood as an essential condition, even though their role is not so emphasized.

These areas constitute the basic framework for creating a management plan of the new capabilities in an economy that is taking shape. The new economy in the near future will dominate the competitive landscape shaped by large discontinuities. These provide great opportunities for companies that can quickly respond to reassess the nature of their core competencies and focus on the acquisition of new capabilities that will shape their future.

Acceptance of these areas within the company itself and also its surroundings are conditions which are formed from both external and internal elements, influencing the creation, implementation and use of performance measurement systems.
